The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazucyoo Oscegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by Partial Econt digestion of Drosophila DNA provided by the BDGP from the Isogenic strain y2; cn bw 4p, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or fillters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ή;

                                                                               Novel secreted factor encoded by clone P00210D09 useful for diagnosing, treating and/or preventing various cardiac, renal and inflammatory
                                                                                                                                               The present sequence is a novel secreted factor encoded by rat cDNA clone P00210D09. The invention relates to a polypeptide comprising a sequence of at least 80% identity to residues 22.122 of the present sequence, or a sequence encoded by a nucleic acid hybridising under stringent conditions to the complement of the coding region comprising 1031 nucleotides, and having at least one biological activity of the polypeptide encoded by clone P00210D09. The polypeptides and polynucleotides of the invention are useful for the treatment of cardiac, renal and inflammatory diseases. The polynucleotides are useful in antisense mediated gene inhibition and in gene therapy. The polypeptides are useful in assays for identifying lead compounds that may be used as therapeutic agents in the treatment of cardiac,

The present sequence is obtained from a clustral X alignment with protein 608. Protein 608 was identified using the method of the invention after subjecting rate osteoblasts to mechanical stress. Expression of the cost of genes was found to be upregulated by about 3-fold in cells subjected to mechanical strain. The specification describes a method for the identification of genes responsive to a specific mechanical stress. The method comprises applying the mechanical stress to an organism (tissue or cells comprising bone cells), isolating the specific cellular fractions and extracting mRNA from them, and differentially analysing the mRNA in comparison with control samples. The method is used to identify genes whose expression is responsive to a specific stress. The identified genes are employed in determining risk associated with a physiological or disease state. The risk determination methods are used for testing a medicament for gene this responsive to a specific stress. The invention, are used for treating, preventing or controlling a physiological or disease state (especially osteoporosis or the symptoms or other factors causing or contributing to osteoporosis or its symptoms or other conditions involved in mechanical stress or its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ж

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel polynucleotide sequences from Arabidopsis thaliana, tobacco (Nicotiana tabacum) and Chilopsis linearis which contain the coding region for a plant formylglycinamidine-ribotide synthase (E.C. 6.3.5.3), an enzyme used in purine biosynthesis. The products of the invention have herbicide, defoliant and desicant formylglycinamidine-ribotide synthase can be expressed in prokaryotic or eukaryotic cells, e.g. to produce transgenic plants with increased resistance to herbicides that target formylglycinamidine-ribotide synthase and to prepare a test system for identifying inhibitors of formylglycinamidine-ribotide synthase. Such inhibitors are potentially useful as defoliants, desiccants or especially this sequence represents the tobacco formylglycinamidine-ribotide synthase. Such this sequence represents the tobacco formylglycinamidine-ribotide synthase. Such this sequence represents the tobacco formylglycinamidine-ribotide synthase described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Magnesium chelatase; transgenic; herbicide; gene marker; plant breeding;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       50 MWDDLMQVIDGASRILERSLSSRSRVIANYALVPFHDPDIGPVTLTADPVVFQRELRQLY 109
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             652 vleklcs----gavsaniiggvtsspivelrvdgvthlndktsvlrdm-weetsfglek 705

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               õ
                                                                                                                                                                                                                                                                                                 The invention relates to nucleic acid fragments encoding magnesium chelatase subunits. The nucleic acid fragments may be used to create transgenic plants in which the new polypeptides are present a thigher or lower levels than normally found, and for overexpression in bacterial or yeast hosts to efficiently produce large amounts of the encoded or yeast hosts to efficiently produce large amounts of the encoded or yeast hosts to efficiently produce large amounts of the encoded or polypeptides which could then be used for screening different compounds for potential herbicidal activity. The polynucleotides may also be used as probes for genetic and physical mapping the genes that they are part of, and as markers for traits linked to these genes. Such information is useful in plant breeding. The polypeptides are used for preparing antibodies, which are useful for detecting the polypeptides in situ or in vitro, and as a target to facilitate design and/or identification of inhibitors of enzymes that may be used as herbicides. Host cells may also be used directly for screening different compounds for potential culturity. The present sequence represents the soybean

The SKC-2 gene was isolated from S.equisimilis type C by gene amplification from the synthetic primers SK1, SK2 and SK3 (see AAQ20666-8). The SKC-2 gene was inserted into yeast expression vector PPS-7 for extracellular expression of streptokinase and into pNAO for intracellular expression in yeast. For expression in bacteria, the SKC-2 gene was inserted in plasmid pEKG3, between a trp promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         95 ddyfevidfas---datitdrn----gkvyfadkd-gsvtlptgpv-----qeffls 138

Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the N-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        104 ELRQLYVQGGGDCPEMSVGAIKAAVEVANPGSFIYVFSDARAKDYHKKNELLQLLQLKQ- 162

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence was deduced from DNA obtd. from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C ) ATCC 10009 or ATCC 9642.

The gene was truncated by 15 codons at the 3' terminal and engineered to add a Met codon prior to codon 16 of the minal and engineered to add a Met seque expression Streptokinase CDS. The construct was used to prepare expression vector pGC606 for prodn. of the streptokinase core molecule. See also AAR12887-R12889, AAR12891-R12893, AAR128885 and AAR12522.

                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the N-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SKC-2. Streptokinase forms a complex with plasmingen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thromboshi; thromboembolism, surgical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present sequence represents a mutant protein of the streptokinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      52 DDLMQVIDGASRILERSLSSRSRVIANYALVPFHDPDIGPVTLTADPV------VFQR 103

Recombinant production of streptokinase mutants, useful as thrombolytic agents for treating myocardial infarction, that are truncated at the N-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1:119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              52 DDLMQVIDGASRILERSLSSRSRVIANYALVPFHDPDIGPVTLTADPV------VFQR 103

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a mutant protein of the streptokinase SKC-2. Streptokinase forms a complex with plasminogen, activating its conversion to plasmin. The SKC-2 gene was modified to produce the mutant protein. The obtained mutants conserve their capacity for plasminogen activator complex formation, thus having reduced antigenicity. The mutants are derived from the 1-1119 gene fragment, and retain the thrombolytic activity of SKC-2 but, compared with the full-length protein, are less antigenic and retain activity better in presence of antibodies that neutralize activity of the complete protein. The mutants are thrombolytic agents which are useful for treating myocardial infarction, pulmonary thromboembolism, surgical complications and other forms of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                163 --SQVVFVLTGDCGDRTHPGYLAFEEIAS--TSSGQVFQLDKQQVSEVLKWVESAIQASK 218

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of the SK protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  52 DDLMQVIDGASRILERSLSSRSRVIANYALVPFHDPDIGPVTLTADPV-----VFQR 103

                                                                                                                                                                                                                   AAB01295;
                                                                                                                                                                    AAB01295
                                      Dp
                                                                     ò
                                                                                                   g
                                                                                                                                                                                                  The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of a de-immunised SK protein molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    10;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         52 DDLMQVIDGASRILERSLSSRSRVIANYALVPFHDPDIGPVTLTADPV-----VFQR 103

Proteins or their fragments can be rendered non-immunogenic or less immunogenic by identifying one or more potential T cell epitopes and modifying the sequence to eliminate at less one of these T cell epitopes to reduce the immunogenicity of the protein when exposed to the immune system of another organism. The method can be used for the immune system of another organism. The method can be used for the immune system of another organism. The method can be used for the immune system of another organism, a vaccine, a protein used to convert inactive drugs to its active form within a living organism, a vaccine, a protein used as a carrier of other molecule or a protein which binds to other molecules within or introduced within the living organism in order to alter the bio distribution of other molecules, such that the protein does not stimulate immune response in the living organism. The less immunogenic protein is useful in medicione, diagnosis and in manufacture of a therapeutic or a diagnostic agent. Streptockinase is produced by certain strains of beta-hemolytic streptockinase is protein has no inherent enzymatic activity but has considerable clinical importance of inherent enzymatic activity but has considerable clinical importance of inherent enzymatic activity but has considerable clinical importance of inscolution of fibrin filaments in blood clots. Streptokinase is an effective thrombolytic agent in the treatment of coronary thrombosis, improving survival and preserving left ventricular function following mycouring anthodies in humans generally limits the protein to a single use. The native protein is immunogenic and the protein to a single use. The native protein the sequence of the wild type streptokinase. The is altered streptokinase sequence

carrier of other molecule or a protein which binds to other molecules within or introduced within the living organism in order to alter the bod distribution of other molecules, such that the protein does not stimulate immune response in the living organism. The less immunogenic protein is useful in medicine, diagnosis and in manufacture of a therapeutic or a diagnostic agent. Streptokinase is produced by certain strains of beta-haemolytic streptococci. The protein has no inherent enzymatic activity but has considerable clinical importance owing to its ability to efficiently bind human plasminogen, potentiating its activation to plasmin and thereby promoting the owing to its ability to efficiently bind and thereby promoting the constitution of fibrin filaments in blood clots. Streptokinase is an effective thrombolytic agent in the treatment of coronary thrombosis, improving survival and presserving left ventricular function following production of neutralising antibodies in humans generally limits the production of neutralising antibodies in humans generally limits the protein to a single use. The new method could provide a longer therapeutic use for streptokinase. This is the sequence of the altered streptokinase. The wild type streptokinase sequence is given in AAB01295. See GENESED records AAB01289-B01302.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rivickhoefer, V.A.; Rome, L.H.
Gene 151, 257-260, 1994
A;Title: The sequence of a cDNA encoding the major vault protein from Rattus norvegicus.
A;Reference number: 153908; MUID:95129871
A;Accession: 153908
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: mRNA
A;Residues: 1-895 <RES>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ಡ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  C;Species: Rhodococcus sp.

-!- FUNCTION: CATALYZES THE CROSS-LINKING OF PROTEINS AND THE CONJUGATION OF POLYAMINES TO PROTEINS. IT IS RESPONSIBLE FOR THE LATER STAGES OF CELL ENVELOPE FORMATION IN THE EPIDERMIS AND THE HARR FOLLICLE.

-!- CATALYTIC ACTIVITY: PROTEIN GLUTAMINE + ALKYLAMINE = PROTEIN N(5)-ALKYLGHUTAMINE + NH(3).

-!- COFACTOR: CALCIUM IS REQUIRED FOR TRANSCLUTAMINASE ACTIVITY.

-!- SUBUNIT: THIS ENZYME CONSISTS OF TWO POLYPEPTIDE CHAINS, WHICH SER SYNTHESIZED AS A PRECURSOR FORM OF A SINGLE POLYPEPTIDE.

-!- SIMILARITY: BELONGS TO THE TRANSCLUTAMINASE FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SIMILARITY).
SUBCELLULAR LOCATION: CYTOPLASMIC, 5% ARE NUCLEUS ASSOCIATED AND LOCALIZE TO THE NUCLEAR PORE COMPLEXES.
TISSUE SPECIFICITY: PRESENT IN MOST NORMAL TISSUES. HIGHER EXPRESSION OBSERVED IN PRITHELIAL CELLS WITH SECRETORY AND EXCRETORY FUNCTIONS, AS WELL AS IN CELLS CHRONICALLY EXPOSED TO EXCRETORY FUNCTIONS, AS WELL AS IN CELLS CHRONICALLY EXPOSED TO XENOMENOTICS, SUCH AS BROWCHIAL CELLS AND CELLS LINING THE INTESTINE. OVEREXPRESSED IN MANY MULTIDRUG-RESISTANT CANCER CELLS. SIMILARITY: STRONG, TO D. DISCOIDEUM WYDA AND MYPB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NAT. Med. 1:578-582(1995).

-!- MUCTION: UNKNOWN, THOUGH MYP IS REQUIRED FOR NORMAL VAULT STRUCTURES THAT MAY BE STRUCTURE. VAULTS ARE MULTI-SUBUNIT STRUCTURES THAT MAY BE INVOLVED IN NUCLEO-CYTOPLASMIC TRANSPORT.

-!- SUBUNIT: MAJOR COMPONENT OF THE VAULT, A LARGE RIBONUCLEOPROTEIN PARTICLE. THE VAULT CONTAINS FOUR PROTEINS OF WA 210 KDA, 192 KDA, 104 KDA AND 54 KDA, RESPECTIYELY, AND A SPECIES OF SMALL RNA OF CIRCA 140 BASES IN RELATIVE MOLAR RATIOS OF 3:1:55:7:9 (BY

                                                                                                                                                                                                                                                                                                                              "Cloning and overexpression of glycosyltransferases that generate the "Cloning and overexpression of glycosyltransferases that generate the lipopolysaccharide core of Rhizobium leguminosarum.";

J. Biol. Chem. 273:26440(1998).

- I- FUNCTION: NECESSARY FOR EFFICIENT RNA POLYMERASE TRANSCRIPTION ELONGATION PAST TEMPLATE-ENCODED ARRESTING SITES. THE ARRESTING SITES IN DAN HAVE THE PROPERTY OF TRAAPING A CERTAIN FRACTION OF ELONGATION RNA POLYMERASES THAT PASS THROUGH, RESULTING IN LOCKED TERNARY COMPLEXES. CLEAVAGE OF THE NASCENT TRANSCRIP BY CLEAVAGE FACTORS SUCH AS GREA OR GREB ALLOWS THE RESUMPTION OF ELONGATION FROM THE NEW 3'TERMINUS, GREA RELEASES SEQUENCES OF 2 TO 3 NUCLEOTIDES (BY SIMILARITY).
                                                                                                                                                                                                                                                                                           Kadrmas J.L., Allaway D., Studholme R.E., Sullivan J.T., Ronson C.W., Poole P.S., Raetz C.R.H.;
